

FIT-BUDDY AI – NORMAL BRAINSTORMING DISCUSSION

Member 1: Guys, our project is **Fit-Buddy AI**. Let's first decide what problem we're actually solving.

Member 2: I think many people want to exercise, but they don't know what workout is suitable for them. So our AI could create a plan based on their goals.

Member 3: Yeah. We could ask things like fitness level, goal, available time, and whether they have gym equipment.

Member 4: And instead of giving everyone the same plan, Gemini could generate a different plan for each user.

Member 5: We should also make it interactive. For example, if someone says, "I only have 15 minutes today," the AI could modify the workout.

Member 1: That's a good point. So it's not just a workout generator; it's more like a **fitness buddy**.

Member 2: We could also add a chatbot where users can ask fitness-related questions.

Member 3: What about tracking progress? If users complete their workouts, we could show their weekly progress.

Member 4: Maybe add reminders and daily goals too. The interface should be simple so users don't feel overwhelmed.

Member 5: Technically, we can use **Gemini models** for understanding the user's input and generating personalized plans. Firebase could handle user data and progress.

Member 1: What about nutrition?

Member 3: We can include general healthy meal suggestions, but we should avoid presenting it as medical or clinical advice.

Member 2: Agreed. Another useful feature could be adapting the plan based on feedback like "This workout was too difficult."

Member 4: So the AI learns from the user's feedback and adjusts the next plan.

Member 5: Then our main flow could be: **User details → AI-generated plan → Workout → Feedback → Updated plan → Progress tracking**.

Member 1: Perfect. I think our main idea is clear: **Fit-Buddy AI should feel like a personalized fitness companion rather than just a workout app**.

All: Yeah, let's go with that!
